Week 13 - Exercises

1) Create a Python script that reads a text from a multiline text file, and prints the first line only.

2) Update the previous exercise to warn the user of the file doesn't exist.

3) Create a Python script that asks the user whether he wants to write to a file or read from a file. If the user chose to read from a non-existing file, he will be asked to write it first.

4) Create a Python script that asks the user to create a file (file write), however, the script must also ask the user to input the name of the file using input function. Then it will ask the user about the content that should be written to that file.
